PokeDB

The PokeDB project will result in a searchable database of minimum complexity which can effectively store, hold, and return data from input Pokemon. The database will need to deal with values concerning the Pokemon such as basic stats, attacks available, and attack information. The goal of this project is to create an easily searchable data resource for those wishing to begin their Pokemon journey.

Questions that could possibly be queried include:
Projected result of an Attack between two Pokemon in database
Information about a particular Pokemon (Available moves, stats, etc.)
Information about a particular Attack
Which Pokemon are capable of a particular Attack
